

For Next Day

- List two “pointer fails” that demonstrate an incorrect use of pointers. For each, explain why it’s a problem.
- Write and test a function `scanfIntArray()`, to read values from the keyboard into a given array of a given size and return the number of values read:

```
int scanfIntArray(int a[], int n);
```

- Write and test a function `max_min()`, to find the smallest and largest values in a given array:

```
void max_min(int a[], int n, int *mx, int *mn);
```

- While not necessary, it may help to keep track of your call stack to track the pointers.
